Handoff

When an AI gets stuck, it hires a human for 15 seconds.

SHAPE OF THE 3 MINUTES

0:00 Hook — the failure everyone has

0:25 DEMO (the whole middle)

1:40 Why it's only possible here

2:05 Who buys it

2:35 Close + ask

> **The first one it couldn’t know.**
> **The second one it shouldn’t decide.**

That's the whole pitch. If you only land one thing, land that.

0:00 HOOK

“Everyone here is shipping agents. They all break the same way — the agent hits one thing it can’t resolve, and stops.”

“It waits for a human who isn’t watching. The work just dies there.”

Then straight into the demo. No preamble, no roadmap slide, no "let me tell you about web3."

0:25 DEMO — PART 1

▸ Point at the QR on screen.

“Scan that. You’re now the labor pool.”

▸ Hit run. Agent starts clearing invoices.

“This is an accounts-payable agent. Eight invoices, real policy, real checks.”

STOP 1 — it can't know

▸ Agent halts on ACME. Phones buzz.

“Vendor name doesn’t match our approved list, and the bank account changed. Rebrand, or someone impersonating a supplier?”

“That fact isn’t in any system. It’s in a person’s head.”

▸ Race resolves. Someone wins, answers, gets 40¢.

“Forty cents, settled, to a stranger who joined ten seconds ago.”

1:05 DEMO — PART 2

▸ Agent resumes. Two more clear.

STOP 2 — it shouldn't decide

“Eighteen percent over the purchase order. Policy caps at ten. The overage is expedited freight the customer asked for.”

“A smarter model doesn’t fix this. It’s a judgment call with money on both sides — and it isn’t the agent’s to make.”

▸ Different person wins it. (Routing deprioritizes whoever was just paid.)

> **The first one it couldn’t know. The second one it shouldn’t decide. Neither gets solved by a better model.**

1:40 WHY THIS COULDN'T EXIST BEFORE

“That job paid forty cents. On card rails, moving forty cents costs about thirty cents plus a percentage.”

“The business doesn’t fail because nobody thought of it. It fails on arithmetic.”

- Sub-cent fees + sub-second settlement → a 40¢ job clears a profit
- **QuickNode** — every send and every confirmation; we rebroadcast until it lands
- 200 payouts that all have to land is a delivery problem, not a UI problem

Say "blockchain" at most once. Nobody is buying the chain.

2:05 WHO BUYS IT

“Agent platforms and frameworks. They hit this wall constantly and can’t solve it themselves — because the blocker was never the labor, it was the payment.”

- They install an SDK; every agent gains a human fallback
- The frameworks bring the demand — we don’t chase end users
- Supply already exists: annotation and gig pools, paid badly and slowly
- **Revenue:** take rate on task volume

2:35 CLOSE

“Every agent you deploy this year will get stuck. Right now that means it stops. We make it ask.”

▸ Gesture at the room.

“Everyone here just got paid by an AI. That’s the product.”

Ask: intros to agent platforms, and a pilot.

REBUTTALS — MOST LIKELY FIRST

Isn't this Mechanical Turk?

→ MTurk is batch: minimums, days-long payouts, human-initiated. Nothing does real-time, agent-initiated, sub-dollar hiring. Payment was the blocker, not labor.

Why not a virtual card or Stripe?

→ Thirty-cent floor. A forty-cent job can't exist on those rails at any volume.

Is the demo scripted?

→ The prompt states the policy and when to escalate — never the two cases. The model finds them. Hand me a ninth invoice and I'll add it live.

Won't better models eliminate this?

→ That's what the two stops are for. One is missing information, one is missing authority. Neither is an intelligence problem.

Fifteen seconds is slow for an agent.

→ It's the fallback path, not the hot path. The alternative isn't "faster" — it's the task failing and waiting hours for you.

Quality? These are strangers.

→ Redundancy and consensus for high-stakes tasks, reputation scoring over time. Tonight is one worker because we have three minutes.

Where does supply come from at scale?

→ It already exists — annotation and gig platforms. We're a better payout rail for the same people.

Isn't this a webhook and a payment?

→ The product is routing, the claim race, eligibility, and settlement. The invention is a tool call that blocks until a human answers.

Why is it on devnet?

→ One constant. Mainnet is a mint address — the economics are identical. Don't apologize, don't dwell.

What if nobody answers?

→ Dispatch widens at six seconds, escalates at twelve, and the agent degrades to holding the invoice. You'll see it if the room is shy — it's built in.

How big is this really?

→ Bounded by one rule: answerable in fifteen seconds by someone with no context. That's the shape of the market, and it's every agent deployment.

IF SOMETHING BREAKS

Wifi dies

→ Backup video. Keep talking over it — don't narrate the failure.

Nobody claims

→ "Watch — it expands the shortlist automatically." It's a feature. Let it run.

Payment stuck pending

→ "Sent, confirming — here's the signature." Still true. Move on.

Agent doesn't stop

→ Force-stop on /control. Don't explain it.

Don't

- Don't explain the architecture
- Don't read the invoice list aloud
- Don't apologize for devnet
- Don't say "blockchain" twice
- Don't fill silence during the race — let them watch
